

The artifact I chose for this assignment is the final project from CS260 where we had to create a project using a binary search tree. The only I had made allowed the user to load, search, and display courses by interacting with the menu. I selected it because it showed the implementation of a data structure and was the first time I had done that during my education. It also uses recursive algorithms for insertion, traversal, and searching, by doing this it can help solve problems relating to courses and prerequisites in school. I did add some enhancements to this program, one of them is adding a course delete function in order to support BST operations. Another enhancement I made was improving the memory management of the program by cleaning up dynamically allocated loads more properly than I had before. The third enhancement I added is a way to validate the data so the data integrity is improved. The final enhancement was just cleaning up the user interface and how the program handles errors so its all more user friendly. Id argue the strongest course outcome is the ability to design and evaluate solutions that solve a problem with algorithmic principles and software development best practices and standards for its solutions.
